Introduction

The Gravity syndrome start up field is the planet “Amenis” which encompasses 2 meteorites X&Y=centering points of the major meteorite Z=points determined as negative agents on “a red axis plane ⇒ point of alert” with a constant decent towards the earth and produce ecological deficiency at the atmospheric level. The major meteorites Z ejection climax and radical sustaining negative energy causing nitrogen atmospheric praise Z symmetry games supporting electromagnetic charges and its center point warn of a peak viral reaction. Therefore, the ultimate determination of this pint is the central axis of the two parallel crossing points which rises -0°C from the central axis to be able to propagate a symmetrical infrared wave to the point of tracing of the line which aims at the random path of the perpendicular C. This central axis is at -0°C from the central axis of the radioactive detection wave. The point of release of the hydraulic driving force is a reflection of the atmospheric energy D that is the basic energy of the support of the central axis. The metaphysical equation of gravity syndrome $G \Rightarrow$ appropriate formula of viral displacement at a peak speed towards a -0°C axis in the direction of planet earth [1-7].

The “MN” virus (Multiple Nucleons) or COVID-19 is the virus of the century which comes from the atmosphere, the result is: the gas bulbs cause an expansion of the molecules composing the tissues of the ozone layer and a bursting of the radioactive ions protecting against the ultraviolet rays of the sun, which causes a very dense and contaminated humidity at the level of the atmospheric layer which is held by the electric current of the force of the waters and the force of attraction of the earth collected by the orbit speed of the planet Jupiter/side East/and ejection on the West ozone layer. Currently very low resistance of the ozone layer: $(0.0174691 \text{ CL O}^2)$. The “MN” virus (Multiple Nucleons) or COVID-19's bulbs cause the molecules to expand and the protective radioactive ions to explode, which causes a viral contamination. The viral wave causes hyper radioactive failure which reacts directly on the aquatic energy and propels effects on atmospheric energy which in turn reacts on earth energy first and on the ozone layer second. The “MN” virus (Multiple Nucleons) or COVID-19 viral spread at the terrestrial level: $[(a + b) + c \Rightarrow \sqrt{2,142} \Rightarrow \Pi \Rightarrow [(0.013736.666)] \text{ km}$ from the axis of gravity at the equatorial level which is a resistance of the perforation path of the electromagnetic system of the planet of the support of the rhesus and the density of the influx of the current of the water at the

terrestrial level, element which accentuates the contamination of the waters and causes their deoxygenating something which facilitates the growth of bacteria and the poisoning of atomic nuclei by this fact: the manipulation of the cells goes towards the decrease and stagnates the evolution of the aquatic purgative act. Subordinate detection at a rate of 1000 km/h with a coetaneous breach of an X-ray in the parallel direction of an ejection of a radioactive wave. The “MN” virus (Multiple Nucleons) or COVID-19 spreads via a powered wave detecting the mid-axis diverging at a specifically acute angle parallel to the sun. This reaction diverges around the terrestrial globe to accentuate the distribution factor of toxic gases coming from Pluto. The infrared rejection which propels in the east direction of the wave of projection of a solar ray towards the symmetrical path and parallel to the axis of projection of an ultraviolet ray is based on a curved and radioactive wave. The carbon reacts simultaneously to radioactive functioning and this easily accentuates the rejection of infrared waves propelled into the cell mixing zone located at the level of the Atlantic Ocean and surrounded by pushed radioactivity produces a pulse field set at a regular rate and this to allow the systemic functioning of the cycle of energy reproduction. The energy failure in the solar system disrupts the normal cycle of C energy density at the earth level, causing disturbance in the earth's crusts and causing repeated earthquakes. The relaxation of the cells that make up neurons reflects a stunning subordination through the circuit of toxin destruction in all the gases floating in the universe. The relative conjunctivitis of a fixed point of reference with an angle of 70°C in a position symmetrical or parallel to the sun. The random path is in the form of a combined circuit activated by cells rich in Uranium, an element beneficial to the maintenance of the various components of the atmospheric layers, a point of attachment of the magnetic field that maintains the balance of this entire universe. The origin of the “MN” virus (Multiple Nucleons) or COVID-19 is planet Amenis. Its location is 130,000,000.000 Km from the planet Mars which with its environment rich in nuclear energy maintains a very humid surrounding climate but unfortunately unlivable because of the excess of hydrogen in its atmosphere and the existence of 1 Sulfide agent in its soil. The virus spreads via a powered wave detecting the mid-axis diverging at a specifically acute angle parallel to the sun. This reaction diverges around the terrestrial globe to accentuate the distribution factor of toxic gases coming from Pluto. The planet Amenis anatomical residue is transmitted through the closed space of an axial and perpendicular reflection of a diagonal. To 1/1000 meadows the calculations were exact.

The malfunction is due to atmospheric disturbances and the congestion of energies and more precisely magnetic ones which is an obstacle to the activity of the radiation of the detection waves. Only atmospheric energy is transmitted without difficulty, it is the atmospheric energy B which is captured by detection waves at a speed equal to 120.000.0000 Km/second. The infrared rejection which propels in the east direction of the wave of projection of a solar ray towards the symmetrical path and parallel to the axis of projection of an ultraviolet ray is based on a curved and radioactive wave. An "MN" virus (Multiple Nucleons) or COVID-19 viral wave causes hyper radioactive failure which reacts directly to aquatic energy and propels effects on atmospheric energy which in turn reacts on earth energy first and on the ozone layer in a second step.

Unlike solar energy, the lunar energy reacts humbly on the mechanism of the heating of the planet which by viral interference stops atmospheric radiations in parallel direction while accentuating the crossing of the active viral ions at the level of the atmospheric layer. The relative conjunctivitis of a fixed point of reference with an angle of 70°C in a position symmetrical or parallel to the sun. The random path is in the form of a combined circuit activated by cells rich in Uranium, an element beneficial to the maintenance of the various components of the atmospheric layers, a point of attachment of the magnetic field that maintains the balance of this entire universe. The planet Amenis is maintaining its gravitational support with two 2 electromagnetic fields, held from the tuning center located at the North-West level of the planet via an energy network fixed to a point C which is the central energy force of the Bermuda triangle. Point C reacts on the mechanics of shrinking and widening the Triangle. The 4 opposite angles but connected under a divergence of electric waves under an attraction of the planet Venus only. The amount of hydrogen located in this area is fed from the lunar atmosphere, allowing the operation of the hydraulic system of Amenis in its movement in space. Amenis encompasses in its atmospheric environment three meteorites adjusting three energetic circuits of the atmospheric environment of the planet, each circuit plays a radical role in maintaining a livable atmosphere, Amenis is the source of the Pandemic of COVID-19. It has the same soil structure as Earth. The soil is rich of Granite: Sand + Volcanic rocks Copper & Iron. Amenis contains following energies allowing life on its soil: Oxygen-rich Molecular Mass tuning fork center, Plutonium Molecular Mass, Chemical Energy: Atomic Energy; Substantial Nuclear Energy. As well as it encompasses the following source of energies: Oxygen, Hydrogen, Uranium, Potassium, Methane, Oil, Sulfur, Iodine, Zinc, Aluminum, Sodium.

Mechanism of Viral Transmission

Atmospheric Stage

Crash of the virus of the atmosphere in the aquatic energy network while enveloping itself in walls which allow it to resist the aquatic environment and to make its crossing in the aquatic energy networks to the EAST which is the point the crash of the viral network.

Aquatic Stage

The virus sneaks into the depths thanks to its energetic molecular composition rich in Hydrogen, the low temperature favors its survival

the time necessary to capture its adopted nest, of which I am quoting a candidate marine animal of point of life morphology and its residence:
The Blobfish

Land Stage

This stage includes an expansion segment: Contamination occurs by transfer of the virus from the atmospheric stage to the aquatic stage through the phenomenon of evaporation.

Animal to Human Virus Transmission

The animal candidate for viral transmission to human is the "blobfish". Seawater, the concentration of viral particles, It has been known since the end of the 20th century that the world ocean is an immense reservoir of viruses from the surface to hydrothermal vents via the Arctic and marine sediments. In seawater, the concentration of viral particles is 106 to 108 particles per milliliter. On the surface and near the shore, the virus concentrations usually encountered are of the order of 107 viruses per milliliter (i.e. ten thousand viruses per cubic millimeter (one thousandth of a milliliter); the concentration decreases with depth and distance from the shore. Higher concentrations (108 to 109/cm3) are found in marine sediments near the surface.

Blobfish Morphology

To resist it, the flesh of the fish consists mainly of a gelatinous mass whose density is lower than that of water, which allows it to float a little above the ocean floor without having to spend its precious energy while swimming. Gelatin is a protein of animal origin. It is made up of 84 to 90% protein and about 1% mineral salts, the rest being water. It feeds exclusively on marine snow from the upper layers of the water layer. Fish and seafood remain one of the primary sources of dietary mercury in the world. The cartilages of this fish are also very light. This low density flesh is an alternative to the swim bladder found in most surface fish. The blobfish therefore has few muscles. It measures at most 30 cm long. Its morphology is permeable to viruses, even that the cells of its structure are not enveloped.

Blobfish Location

The viral energy trajectory starts from Amenis to reach an impact on the EAST of the earth, more exactly at the maritime level (the Pacific Ocean) and from this point the transfer of the viral configuration from the atmospheric aspect takes its aquatic structure in order to nest at the bottom of the ocean where the cold temperature is ideal for its conversion and multiplication. The blobfish is found at depths where the pressure is nearly a hundred times that of the surface. Very favorable place for the viral implant. The geographical areas of its location are the North Atlantic, the North Pacific and some specific areas of the Southern Hemisphere: Australia, New Zealand, South Africa, and South America.

Schematic Presentation

Schema 1

Meteorites X.Y&Z

- $X=1.726 \text{ al} \Rightarrow$ exact speed of radioactive viral displacement of point x.

- $Y=0.234 \text{ al} \Rightarrow$ exact speed of rejection of the driving force of hydrogen molecules defensive agent.
- $Z=(x + y) \geq (y. 0 \text{ al}) \Rightarrow$ vital point of viral infection.
- $500 \text{ al} \Rightarrow$ time allocated for viral displacement.
- $Z=0 \Rightarrow -0.3180 \text{ al} \Rightarrow Z < 0.3180 \text{ al}$.
- $SG = Z=0 \rightarrow$ on an exact scale (Figure 1)

nuclear energy on the gravity of the axis of centering equivocal with the positive radiation of the interplanetary system against the offensive insight of the terrestrial globe, in case of failure the nucleus reacts directly on the molecular atmospheric energy mechanism and reacts directly on atomic division, which affects the resistance of the organic immune system (Figure 2).

Schema 3

- The circuit maintained by X: Ozone layer.
- The circuit maintained by X: Ozone layer
- The circuit maintained by Y: Perforation layer rich in aquatic energy.
- The circuit maintained by Z: Magnesium-rich UV layer reflecting atmospheric radioactivity outside the environment of the planet Amenis adjusting a hydraulic circuit for pumping space radioactive particles (Figure 3).

Schema 2

The zone of perseverance at the center point of the radioactive viral infection Na- towards a limited axis on a complex zone composed of two agents: nitrogen + manganese in the raw state.

The defective pinching at the level of the centering axis (X & Y) thus forms a blockade at the level of the earth's magnetic field. The subordinate axis of X acts directly on the interplanetary electromagnetic resistance and increases the power of the atmospheric

Figure 1: In the schema we can see in Red Lines the viral circuit trajectory from "Amenis" to Earth, 'Amenis' gravity in the galaxy is maintained with three(3) Meteorites X, Y & Z supported by an electromagnetic circuit based in "The triangle de Bermuda". The schema shows the Location of "Amenis" in the Galaxy. "Amenis" is the atmospheric energetic deficiency platform among the Interplanetary Solar System causing both Pandemic and Climate Change.

Figure 2: This schema shows the exact viral trajectory Viral Trajectory caused by "Amenis" supported by the sun UV motor force from the East and the motor force of "Amenis" energetic circuit from the West. This geometry shows the Central point of the Virus Impact on Earth.

Figure 3: The schema shows "Amenis" Atmospheric Energies Trajectory's Strategy to Earth-1. A global impact on the intensity of the motor force of energetic system on Earth through the "Triangle de Bermudes", the most intensive in & out energy source that activates the Eastern part of earth and maintains the Hydraulic intensity of the Earth Gravity among the atmosphere, creating a central axis for the transfer of atmospheric particles on Earth.

Conclusion

"MN" (Multiple Nucleons) or (COVID-19) Theory

"It is the virus of the century which affects the atmosphere, as a result: the bulbs of gas cause an expansion of the molecules composing the tissues of the ozone layer and a bursting of the protective radioactive ions against the ultraviolet rays of the sun, which causes a very dense and contaminated moisture at the level of the atmospheric layer which is held from the electric current of the force of the waters and the force of attraction of the earth collects by the speed of orbit of the planet Jupiter/East side/and the massive ejection of the planet Mars by pressure on the West ozone layer. Currently very low resistance of the ozone layer: (0.0174691 CL O2)".
